Lesson 1-5: Method and Constructor References

Method References

- Method references let us reuse a method as a lambda expression

```
FileFilter x = (File f) -> f.canRead();
```

```
FileFilter x = File::canRead;
```

Method References

More Detail

- Format: `target_reference :: method_name`
- Three kinds of method reference
 - Static method
 - Instance method of an arbitrary type
 - Instance method of an existing object

Method References

Rules For Construction

Lambda

Method Ref

`(args) -> ClassName.staticMethod(args)`

`ClassName::staticMethod`

Lambda

Method Ref

`(arg0, rest) -> arg0.instanceMethod(rest)`

`ClassName::instanceMethod`

Lambda

Method Ref

`(args) -> expr.instanceMethod(args)`

`expr::instanceMethod`

Method References

Examples

Lambda

Method Ref

```
(String s) -> Integer.parseInt(s);
```

Integer::parseInt

Lambda

Method Ref

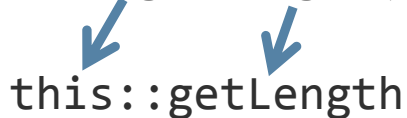

```
(String s, int i) -> s.substring(i)
```

String::substring

Lambda

Method Ref

```
Axis a -> getLength(a)
```

this::getLength

Constructor References

- Same concept as a method reference
 - For the constructor

```
Factory<List<String>> f = () -> new ArrayList<String>();
```

```
Factory<List<String>> f = ArrayList<String>::new;
```

Section 5

Summary

- Method references provide a shorthand notation for simple Lambdas
- Three types depending on how they are used
- Can also be used for constructors
